## while

While loops begin by testing a condition. If it is true, then they execute the loop body. Once the loop body is executed, the condition is tested again, and so forth.

```
count <- 0
while(count < 10) {
    print(count)
    count <- count + 1
}</pre>
```

While loops can potentially result in infinite loops if not written properly. Use with care!

## while

Sometimes there will be more than one condition in the test.

Conditions are always evaluated from left to right.
